Make a plan to boost the visibility of your paper and your research. Consider what strategies from the lecture you can implement. Provide practical examples that relate directly to your research topic. Think about different stages of your research:

1. What can you do right now?
   One of the immediate plans I have right now is to make a project plan for my research as it's best to plan beforehand. Aside from that, to boost visibility, I need to get out there and network with people and share my topic. To do that, I need my ORCID ID, which I have created and linked, and that way, other researchers will be able to find me better. Another strategy I learned is to check for other published papers, and email the authors directly and start commenting on their papers, what was good, my opinion on the paper, questions, and so on. If I get a reply, then I can move on to presenting my paper and asking certain things related to it. I can also join discussions, seminars, or events that are in my field. I should also work to get my core idea through in an easier fashion, that everyone will be able to understand the theme and potential.

2. What can you do when planning to publish your next paper?
   As we learned in the course, we can thoroughly search the journals we can publish and search which ones we can publish through journal finders, and check the details on requirements and so on. However, it's important to note that if your paper can't be published in the journal that you wanted, you should be able to publish it in the University of Oulu website. I should also bear in mind that most people don't read the middle part of the thesis, the how to's, and focus on abstract and the result section, which I should make sure that people understand well. Such as having simpler model, for example.

3. What can you do once your article has been published?
   I should make sure that published article is under my name and IDs. This means that I should link to places such as in ORCID or scopus. I can also share my paper to other channels and tell that it's published to like social media such as linkedin. I should also keep an eye on who cites my paper and how it's taken in the public eyes. We learned that we can use Altmetric to do those things. I will also use my previous paper on my next paper if possible.

This assignment won't be graded. It is enough that you make a submission.
